

## STRONG MEMORIAL HOSPITAL

## X-RAY REPORT

Name.....

Service.....

E-3

Unit No.....

DC-2-J

12-18-45 ORAL CHOLECYSTOGRAM. The gall bladder is visualized but does not concentrate the dye well. No filling defects are noted on these films. After fatty meal there is a minimal degree of shrinkage of the gall bladder.

These findings would be suggestive of a low functioning gall bladder. However, it is noted on the request that the patient has jaundice. Cholecystography in the presence of jaundice often results in a poor or negative filling.
